Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                       This invention describes novel human and mouse anti-apoptotic gene products which contain at least one death effector domain. The products of the invention are used in the treatment of HIV infections and autoimmune diseases.
                                                                                                                                                                                      1 MSAEVIHQVEEALDTDEKEMLLFLCRDVAIDVVPPNVRDLLDILRERGKLSVGDLAELLY

This is the amino acid sequence of the beta isoform of novel thuman G1 protein. The sequence is deduced from an isolated skin thuman G1 protein. The sequence is deduced from an isolated skin thousant cDNA clone (see AAV52895). G1-beta (also called CASH beta, G2SH being caspase homologue) and a longer isoform, G1-alpha (see CASH being caspase homologue) and a longer isoform, G1-alpha (see CASH being caspase homologue) and a longer isoform. These G1 proteins are capable of binding to the first modules, with MORT-1 or with MORT-1 binding proteins such as McH4 (CASP-10) and MACH (CASP-8), and indirectly, via their N-terminal MORT modules, with MORT-1 or with CC charles and proteins such as McH4 (CASP-10) and MACH (CASP-8), and the p55 tumour necrosis factor (INF) receptor, to which MORT-1 binds, or of binding to the intracellular domain of the p55 tumour necrosis factor (INF) receptor, to which mort-1 binds, or of binding to the intracellular considered as mediators or modulators of FAS-R having a role in the signalling process or initiated by the binding of FNE to p55-R. The longer isoform also cinitiated by the binding of FNE to p55-R. The longer isoform also considered as appease activity region involved in cytocoxic activity. G1 DNA (I) and polypeptide (II), vectors and fragments or used to requlate cell death, or inflammatory processes. (I) and (II) regulate the FAS-R ligand or TNF effect on cells carrying an FAS-R or p55-R. Tumour, HIV-infected or other considered cells can be treated using a viral vector encoding a viral curface protein, which binds a specific cell aviface receptor and a sequence encoding (II), which kills the cell. Antisense considering an also be regulated the above effects. These conservances in a cellular mRNA encoding (II), and allows (II) and can also regulate the above cector blocking and allows (II) and can also regulate the above effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RVRRFDLLKRILKMDRKAVETHLLRNPHLVSDYRVLMAEIGEDLDKSDVSSLIFLMKDYM 120

                                                                                                                                                                                                                                                      The present sequence represents human FLICE-like inhibitory protein short form, designated FLIP-S. The present invention describes a new treatment of a condition characterised by vascular wall inflammation in a subject comprising administering a FLIP molecule to inhibit Fas ligand-mediated apoptosis of vascular endothelial cells in the subject. The method can be used to treat atherosclerosis, transplant arteriosclerosis and

                                                The present sequence represents novel human MACH-related inducer of toxicity (MRIT) isoform MRIT beta 1, a CED-4 homologue. Multiple isoforms of MRIT have been identified, some of which function to induce caspase dependent apoptosis in mammalian cells, e.g. mrit alpha 1 (see AAY05787) and MRIT beta 1, while others have anti-apoptotic activity, e.g. MRIT alpha 2 (see AAY05788). MRIT beta 1 lacks the N-terminal death effector domain of MRIT alpha 1 but includes a C-terminal caspase ICE homology domain region. Selective enhancers and inhibitors of MRIT apoptotic activity can be identified and used to treat diseases mediated by the dysfunction be identified and used to treat diseases mediated by the dysfunction of programmed cell death or proliferation. A cell accumulation disorder such as cancer, autoimmune disease, viral infection, anglogenesis or atherosofierosis is treated by administering an agent that selectively enhances MRIT apoptotic activity, thereby inducing apoptosis in a subject. A disorder of cell loss, such as a neurodegenerative disorder, including Alzheimer's disease, retinitis pigmentosa, stroke, aplastic anaemia, myocardial infarction or Allos can be treated by administering an agent that selectively inhibits MRIT apoptotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

combination polypeptide which comprises a portion of an anti-apoptotic polypeptide which inhibits apoptosis of lymphocytes in combination with a transport group is described. The transport group is described. The transport group is described. The transport group c is appain of transporting the chimeric group or fusion peptide across the cell membrane. The anti-apoptotic polypeptide is FLICE-like across the cell membrane. The anti-apoptotic polypeptide is FLICE-like inhibitor protein (FLIP) which inhibits has and THF mediated apoptosis by inhibiting binding of Caspase-8 to the Fas receptor complex, thus so that fusion peptide are useful for inhibiting ligand-induced apoptosis of by bringing them into contact with T cells. The chimeric group is cuseful for expanding T cells in vitro e.g. T cells specific for particular antigens such as tumour-specific antigen, for enhancing T cells antigens such as tumour-specific antigen, for enhancing T cells antigens and as tumour-specific antigen, for enhancing T cells also useful for theappetist of chronically activated CD4*+ T cells in HTV infected patients. The chimeric group is also useful for theappetic, prophylactic or diagnosis of intracellular delivery of small molecules and mucleic acids encoding such polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to testing candidate compounds to determine whether they affect NF-kappab. JNK and apoptosis activity. The method involves the use of 2 death effector domains (DED). The compounds identified by the invention have therapeutic applications and are useful for regulating cellular NFkappaB. JNK and apoptosis activity. The assay is useful for identifying pharmacological agents or lead compounds generally involved in assaying for compounds which regulate or modulate a cell activity. The present sequence is a prodoamin used in the invention.

                                                                                                                                                                                                                                                                                                             The present sequence has been shown to regulate the nuclear factor-kappa B (NF-kB), Jun N-terminal Kinase (JuNK) and apoptosis pathways. It is provided in a specification relating to novel mutants (D73A, L74A and L75A) for Caspase-8, which are also useful for regulating NF-kB, JuNK and apoptosis activities. The Caspase-8 mutants are useful for therapeutic purposes and in test methods or assays for determining whether a candidate compound has a significant effect upon cell activities, especially NF-kB, JuNK and apoptosis, so as to facilitate the discovery and/or design of therapeutic agents.

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule (II) encoding a natural dominant congative regulator of caspase 8, FLIP-c, where (I) specifically hybridises with and inhibits expression of the protein, or specifically hybridises with and inhibits expression of the protein, or specifically hybridises with an least an 8-nucleobase portion of an active site on (II). (I) has antiinflammatory and anti-tumour activities. (I) is an inhibitor of FLIP-c expression, a modulator of apoptosis and can be used in antisense gene therapy. (I) is useful for inhibiting the expression of FLIP-c in cells or tissues, and for treating an animal having a disease or condition associated with FLIP-c. (I) is also useful for modulating apoptosis in a cell, where a caspase such as caspase 8, caspase 3 or caspase 7 is activated, and the FLIP-c is the long form of FLIP-c. (I) is also useful for diagnostics, therapeutics, prophylaxis, as research reagents and Kits, for distinguishing functions of various members of a biological pathway, and in antisense gene therapy. (I) is also useful community for the present sequence represents human FLIP-c as given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 RVRRFDLLKRILKMDRKAVETHLLRNPHLVSDYRVLMAEIGEDLDKSDVSSLIFLMKDYM 120

                                                                                                                                                                                                                                                                                                                                                                                                    FLAME 1 or 2) and nucleic acid molecules encoding such proteins. FLAME sequences are useful for inhibiting apoptosis and for gene therapy of diseases characterised by apoptosis including HIV infection and Alzaheimer's disease. FLAME inhibitors are useful as apoptotic agents and activators are useful as anti-apoptotic agents. FLAME-1 is useful as a substrate for caspase in assays to identify caspase inhibitors. The present sequence is human FLAME-1b protein.
                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to FADD-like apoptotic/anti-apoptotic proteins

This is the amino acid sequence of human FLAME-1, or FADD-like apoptotic/anti-apoptotic molecule 1. FLAME-1 is a novel apoptotic protein that interacts specifically with FADD, Mch4, mch5 and FLAME-2. It is recruited to the Fas receptor complex and can abrogate FasyTNF-induced apoptosis upon expression in FasyTNF-induced from the nucleotide sequence (see AAV74136) of cfFLAME-1 was deduced from the nucleotide sequence (see AAV74136) of a Jurkat cell-derived cDNA clone. Host cells, recombinant vectors, and methods of using FLAME-1 to identify substrates, activators or inhibitors of FLAME-1 are provided. FLAME-1, FLAME-2 (see AAW90108) and agonists can be used to inhibit apoptosis, e.g. for treating interaction or Alzheimer's disease. Inhibitors can be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    oŧ

(FLAME 1 or 2) and nucleic acid molecules encoding such proteins. FLAME sequences are useful for inhibiting apoptosis and for gene therapy of diseases characterised by apoptosis including HIV infection and Alzheimer's disease. FLAME inhibitors are useful as apoptotic agents and activators are useful as anti-apoptotic agents. FLAME is useful as a substrate for caspase in assays to identify caspase inhibitors. The present sequence is human FLAME-1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           anti-apoptotic; cancer; autoimmune disease; angiogenesis; atherosclerosis; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; retinitis pigmentosa; stroke; AIDS; infection; aplastic anaemia; myocardial infarction; therapy; mutent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The results
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents MRIT beta 2, comprising amino acid residues 1-227 of novel human MACH-related inducer of toxicity MRIT alpha 1 (see AAY05787). This deletion mutant was used to examine the interaction of MRIT alpha 1 with caspases. The results indicated that the C-terminal 216 residues of MRIT are not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MRIT beta 2; MACH related inducer of toxicity; human; apoptosis;

                                                                                                                                                                 The invention provides recombinant nucleic acid molecules encoding usurpin-alpha (lacking the first death effector domain (DED) or its prodomain), usurpin-beta or usurpin-gamma. Usurpin polypeptides are
                                                                                                                                      Gaps
 sufficient for FLICE-P20 interaction. The invention provides multiple isoforms of MRIT (see AAY05787-89), isolated active fragments of which have either pro-apoptotic or anti-apoptotic activity. Selective enhancers and inhibitors of MRIT apoptotic the dysfunction of programmed cell death or proliferation, such as cancer or a neurodegenerative disorder.

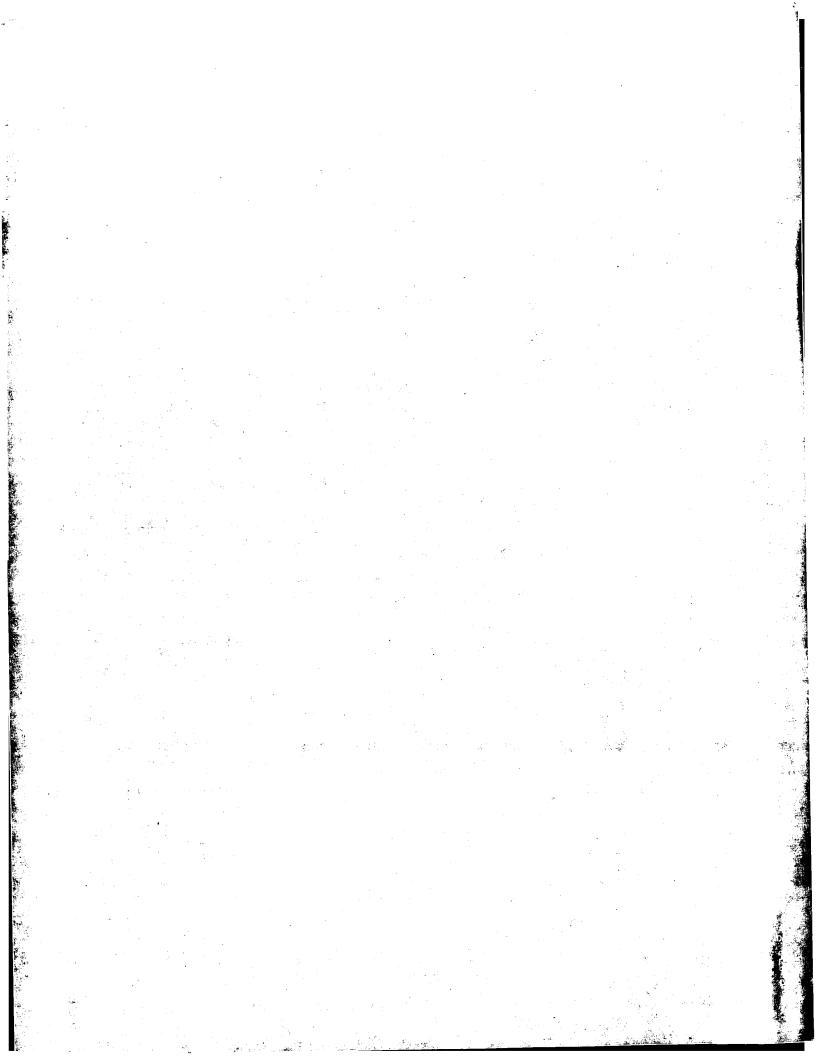

Whote: the present sequence is not shown in the specification but is derived from the MRIT alpha I sequence given in figure IF.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           useful for in vitro and in vivo identification of usurpin-procaspase-8 interaction inhibitor. Usurpin is useful as modulator of the sensitivity of cells to CD95(Fas/Apo-1) mediated apoptosis. Modulation of apoptosis is useful for treating diseases like autoimmune diabetes, cancer and parkinson's disease. Activators and inhibitors of usurpin-procaspase-8 interaction are also useful for treating various diseases mediated by apoptosis. Usurpin provides an attractive model for modulating caspase activation. Sensitivity of cells bearing CD95(Fas/Apo-1) receptor can be regulated at several levels in the presence of usurpin, conferring resistance to Fas-ligand cell death. The present sequence represents the usurpin-beta polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

This invention describes novel human and mouse anti-apoptotic gene products which contain at least one death effector domain. The products of the invention are used in the treatment of HIV infections and

TISSUE SPECIFICITY: WIDELY EXPRESSED. HIGHER EXPRESSION IN
SKELETAL MUSCLE, PANCREAS, HEART, KIDNEY, PLACENTA, AND PERIPHERAL
BLOOD LEUKOCYTES. ALSO DETECTED IN DIVERSE CELL LINES. ISOPORM 8
IS PREDOMINANTLY EXPRESSED IN TESTIS AND SKELFTAL MUSCLE.
INDUCTION: REPRESSED BY IL-2 AFTER TCR STIMULATION, DURING
PROGRESSION TO THE S-PHASE OF THE CELL CYCLE.
DOMAIN: THE CASPASE DOMAIN LACKS THE ACTIVE SITES RESIDUES
                                                                                                                        ARMMALIAN CELLS. ACTS AS AN INHIBITOR OF THERSEG MEDIATED
APOPTOSIS. A PROTEDLYTIC FRACHENT (P43) IS LIKELY RETAINED IN THE
DEATH-INDUCING SIGNALING COMPLEX (DISC) THEREBY BLOCKING FURTHER
RECRUTIMENT AND PROCESSING OF CASPASE-8 AT THE COMPLEX. FULL
LENGTH AND SHORTER ISOFORMS HAVE BEEN SHOWN EITHER TO INDUCE
APOPTOSIS OR TO REDUCE THERSF-TRIGGERED APOPTOSIS. LACKS ENZYMATIC
(CASPASE) ACTIVITY
SUBBULIT: THERSEG STIMULATION TRIGGERS RECRUITMENT TO THE DEATH-
INDUCING SIGNALING COMPLEX (DISC) FORMED BY THRRSFG, FADD AND
CASPASE-8. A PROTEDLYTIC FRAGMENT (P43) STAYS ASSOCIATED WITH THE
BCL-X(L) (IN VIERO).
                                                                                                                                                                                                                                                                                                                                                                                                          Event-Alternative splicing; Named isoforms-14;

            ARAMALIAN CELLS. ACTS AS NI INHIBITOR OF THERSEG MEDIATED
APOPTOSIS. A PROTEDLYTIC FRACHENT (P43) IS LIKELY RETAINED IN THE
DEATH-INDUCING SIGNALING COMPLEX (DISC) THEREBY BLOCKING FURTHER
RECRUITMENT AND PROCESSING OF CASPASE-8 AT THE COMPLEX. FULL
LENGTH AND SHORTER ISOFORMS HAVE BEEN SHOWN EITHER TO INDUCE
APOPTOSIS OR TO REDUCE THERSF-TRIGGERED APOPTOSIS. LACKS ENZYMATIC
(CASPASE) ACTIVITY (BY SIMILARITY)
SUBUNIT: THERSEG STIMULATION TRIGGERS RECRUITMENT TO THE DEATH-
INDUCING SIGNALING COMPLEX (DISC) FORMED BY THERSF6, FADD AND
CASPASE-8. A PROTEDLYTIC FRAGMENT (P43) STAYS ASSOCIATED WITH THE
BLISC (BY SIMILARITY).
                                                                                                                                                                                                               EVENT-ALIETRALIVE SPLICING; Named isoforms-2;
Name-1; Synonyms-FLIP-L, CASH alpha;
Isold-035732-1; Sequence-Displayed;
Name-2; Synonyms-FLIP-S, CASH beta;

-1-TISSUE SPECIFICITY: Highly expressed in heart.
-1-DEVELOPMENTAL STAGE: AT EMBARYONIC DAYS E9:5 AND E10.5 HIGHEST
EXPRESSION IN DEVELOPPING HEBARY.
-1-INDUCTION: ISOFORM 1 BUT NOT ISOFORM 2 IS ACTIVATED BY BCR CROSS-
LINKING IN PRIMARY B-CELLS.
-1-DOMAIN: THE CASPASE DOMAIN LACKS THE ACTIVE SITES RESIDUES
INVOLVED IN CATALYSIS.

Submitted (JUL-1997) to the EMBL/GenBank/DbBJ databases.

-I- FUNCTION: Most upstream protease of the activation cascade of caspases responsible for the TNFRSF/FAS mediated and TNFRSFIA induced cell death. Binding to the adapter molecule FADD recruits it to either receptor. The resulting aggregate called death-laducing signaling complex (DISC) performs CASPB proteclytic activation. The active dimeric enzyme is then liberated from the DISC and free to activate downstream apoptotic proteases.

Proteclytic fragments of the N-terminal propeptide (termed CAP3) cAP5 and CAP6) are likely retained in the DISC. Cleaves and activates CASP3, CASP4, CASP6, CASP7, CASP9 and CASP10. May participate in the GZMB apoptotic pathways. Cleaves ADPRT.

Hydrolyzes the small-molecule substrate, Ac-Asp-Glu-Val-Asp-I-AMC. Likely target for the cowpox virus CRMA death inhibitory protein.

-I- ENEWER ENGULATION: Inhibited by Z-VAD-FK, Crmm and P35.

-I- SUBUNIT: Heterodimer of a 18 kDa (P18) and a 10 kDa (P10) subunit. Interacts with FADD and CFLAR (By similarity).

-I- TISSUE SPECIFICITY: Expressed in a wide variety of tissues.

-I- Linghest expression in spleen, thymus, lung, liver and kidney.

-I- DEVELOPMENTAL STAGE: In the embryo, highest expression occurs at

C. CASPASE-10 TO THE ACTIVATED FAS (CD95) OR THER-1 RECEPPORS. THE CASPASE-10 TO THE ACTIVATED FAS (CD95) OR THER-1 RECEPPORS. THE RESULTING AGGREGAME CALLED THE DEATH-INDUCING SIGNALING COMPLEX.

C. INTIMERS THE SUBSEQUENT CASCADE OF CASPASES (ASPARTATE-SPECIFIC CYSTEINE PROTEASES) WITH CFLAR.

-1- SUBUNIT: INTERACES WITH CFLAR.
-1- SUBUNIT: INTERACES WITH CFLAR.
-1- SUBUNIT: INTERACES WITH CFLAR.
-1- SUBUNIT: OF THE SIGNAL REVOUTES.

C. 1- DOMAIN: CONTAINS A DEATH DOWAIN INVOLVED IN THE BINDING OF THE CORRESPONDING DOMAIN WITHIN FAS RECEPTOR.

C. 1- SIMILARITY: CONTAINS 1 death domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright.
